Dear Hiring Manager,

As a network and infrastructure engineer with over a decade of production operations experience--including managing distributed datacenter networks across 12+ locations--I am eager to apply for the Network Engineer - Datacenter Operations role. My career has been built on keeping large-scale production environments running smoothly, troubleshooting complex incidents under pressure, and building the automation and observability systems that enable proactive operations.

The job description emphasizes true operational ownership and incident response leadership, skills I've honed throughout my career. At OTG Management, I directly managed a geographically distributed network spanning multiple airports and offices, architecting redundant DNS infrastructure that dramatically reduced outages and building service-aware alerting systems that cut MTTR through early detection. I also designed custom Grafana dashboards backed by time-series databases to give operations teams real-time visibility into infrastructure health--exactly the kind of regional observability work this role requires.

My technical background maps precisely to your requirements:

- Production Network Operations: 6+ years managing live datacenter and campus networks, troubleshooting L2/L3 issues, coordinating break-fix, and leading incident response across distributed sites
- Fabric & Routing Expertise: Hands-on experience with BGP, high-availability architectures (VRRP), complex firewall rules, and multi-site connectivity (VPN, secure tunnels)
- Observability & Dashboards: Built Grafana dashboards with SQL-backed data sources; developed proactive monitoring frameworks that reduced downtime
- Scripting & Automation: Expert in Python and PowerShell for operational workflows, API-driven integrations, and infrastructure automation

I'm pragmatic, document as I go, and thrive in high-stakes environments where uptime matters. I'm excited about the opportunity to bring my operational rigor and datacenter experience to support the infrastructure powering next-generation AI.

Best regards,

David Kreuter
